# Web Appendix A - Main Appendix Figures and Tables 

Saving for Multiple Financial Needs: Evidence from Lockboxes and Mobile
Money in Malawi

Shilpa Aggarwal, Valentina Brailovskaya and Jonathan Robinson

Notes: GPS coordinates are shown with added random noise for visibility.

Web Appendix Figure A2. Experimental Design

Panel A. Cumulative usage: Deposits and Withdrawals

Panel B. Deposits and Withdrawals (averages per day, smoothed over 2 week period)

Panel C. Running Balance (averages per day, smoothed over 2 week period)

Notes: Data taken from administrative data from telecom company for mobile money accounts. Panel A shows average (per-person) cumulative deposits, withdrawals and net deposits (the difference) over time. Panel B shows average deposits and withdrawals during the study period. The values are daily averages collapsed into 2 week periods. Panel C shows running balances. The dashed line represents the date at which withdrawals stopped being reimbursed.

| Children's education | 0.12 | 0.12 | 0.24 | 0.09 | 0.16 |
| Home improvement | 0.07 | 0.04 | 0.13 | 0.04 | 0.04 |
| Home expenses (rent, utilities, etc.) | 0.07 | 0.01 | 0.02 | 0.01 | 0.03 |
| Agriculture | 0.04 | 0.04 | 0.08 | 0.01 | 0.03 |
| Observations | 801 | 159 | 160 | 160 | 156 |

Notes: The unit of observation is the individual. List is restricted to goals that were named by at least $5 \%$ of people at baseline. At baseline (in column 1), goals were measured by asking respondents about their current savings in various sources. If the amount saved in a source was non-zero, respondents were asked about what the savings were for

| Observations | 761 |  |  |  | 392 |  |  |  |

Note: Variables are converted to daily values. Means are population weighted. Randomization check_intake is performed only for businesses that appear in the analysis sample (i.e. completed a monitoring survey or at least one phone survey). Monetary values are winsorized at $1 \%$ and expressed in USD.
${ }^{1}$ Expenditures measured at the intake survey are a subset of those in later surveys, and include food, personal items, household items, and transportation.

Panel A. Airtel Transactional History (July 2017 - April 2018)
Used Mobile Money to Deposit/Withdraw Cash ..... 0.95
Average Amount Deposited ..... 117.96(149.82)
Average Amount Withdrawn ..... 130.51
(176.00)
Used Mobile Money to make transfers ..... 0.67
Transfers Sent ..... 14.08(25.99)
Transfers Received ..... 12.29
(29.41)
Used Mobile Money to make payments ..... 0.72
Transactions Made ..... 10.07(16.70)
Observations ..... 246
Panel B. Debriefing questions about mobile money
Used Mobile Money for longer-term savings ..... 0.83
Used Mobile Money to store money temporarily ..... 0.12
Observations ..... 259

Notes: Panel A comes from Airtel administrative data. Data is restricted to accounts with non-zero usage. Panel B comes from responses collected during a debriefing section of the endline survey, at the conclusion of the project. Data is restricted to the mobile money treatment group in the experiment.

| Control SD | - | - |

Notes: Regressions are restricted to observations in which the respondent (or a household member was sick). The dependent variable in column 1 is an indicator for treating an illness fully, and the dependent variable in column 2 is an indicator for treating the illness immediately. All regressions control for strata and are probability weighted (see in the text for details). Standard errors clustered at individual level in parentheses. ${ }^{*}$, ${ }^{* *}$, and ${ }^{* * *}$ indicate significance at $10 \%, 5 \%$, and $1 \%$ respectively.

Web Appendix Table A13. Treatment effects on prevalence of sickness

|  | $(1)$ <br> $=1$ if member of <br> household sick in <br> past week | $(2)$ <br> One lockbox <br> Multiple lockboxes <br>  <br> One mobile money account <br>  <br> Multiple mobile money accounts <br>  <br>  <br> Obst week |

Notes: Standard errors clustered at individual level in parentheses. All regressions control for strata and are probability weighted (see in the text for details).
Standard errors clustered at individual level in parentheses. ${ }^{*}$, **, and *** indicate significance at $10 \%, 5 \%$, and $1 \%$ respectively.

Notes: In Panel A, data comes from the follow up phone survey conducted in September 2019 and collected information on usage in the past 1 month with a randomly selected 200 participants. About $72 \%$ of the random sample was reached. Attrition rates were not different between groups. In Panel B, data comes from the administrative Airtel data for all subjects in the mobile money group. The value and number of deposits and withdrawals are winsorized at $5 \%$ level.

Notes: Deposits (columns 1-2), business earnings (columns 7-8) and total expenditures (column 9) are measured over the past week and converted to daily values.
Labor supply in the main business (columns 3-4) is measured at the daily level in the past 7 days prior to the survey date. Farming is presented over a week since this is how it was measured in the surveys and it is the only way to present the extensive margin. All regressions control for strata, a measure of the dependent variable during the intake survey (where applicable), baseline characterstics, date of the survey fixed effects, assignment to high frequency group and are probability weighted (see in the text for details). All monetary variables are expressed in USD and are winsorized at $5 \%$.
Standard errors clustered at individual level in parentheses. ${ }^{*}$, ${ }^{* *}$, and ${ }^{* * *}$ indicate significance at $10 \%, 5 \%$, and $1 \%$ respectively.
${ }^{1}$ Experimental account is the mobile money or box, depending on the treatment group.

| Control SD | 0.00 | 0.00 | 1.86 | 1.17 |

Notes: Each column is a separate regression of the outcome on the treatments, the given variable, and the interactions between the treatments and variable. The coefficient labeled as " X " is the variable, and the interactions "account * X " are the interactions. The variable "taxed" is equal to 1 if the respondent gave money at baseline but didn't receive. Deposits are measured over the past week and converted to daily values. All regressions control for strata, a measure of the dependent variable during the intake survey (where applicable), baseline characteristics, assignment to high frequency group and are probability weighted (see in the text for details). Survey date fixed effects are included.
Standard errors clustered at individual level in parentheses. ${ }^{*}$, ${ }^{* *}$, and $* * *$ indicate significance at $10 \%$, $5 \%$, and $1 \%$ respectively.
${ }^{1}$ Experimental account is the mobile monev or box. devending on the treatment groun.

Notes: Regressions include individual fixed effects. Deposits (columns 1-2), business earnings (columns 7-8) and total expenditures (column 9) are measured over the past week and converted to daily values. Labor supply in the main business (columns 3-4) is measured at the daily level in the past 7 days prior to the survey date. Farming is presented over a week since this is how it was measured in the surveys and it is the only way to present the extensive margin. All regressions control for individual fixed effects, strata, a measure of the dependent variable during the intake survey (where applicable), baseline characteristics, date fixed effects, assignment to high frequency group and are probability weighted (see in the text for details).
Standard errors clustered at individual level in parentheses. *, **, and $* * *$ indicate significance at $10 \%, 5 \%$, and $1 \%$ respectively.
${ }^{1}$ Experimental account is the mobile money or box, depending on the treatment group.

Notes: The main business outcomes (in Columns 1-2 and 7-8) were measured at the daily level. Labor supply in secondary occupations, farming, credit (Columns 3-4, $5-6$ and $9-10$ ) are presented over a week since this is how it was measured in the surveys and it is the only way to present the extensive margin. There are fewer observations for profits/revenues (compared to main business) because this was only asked for the past 4 days in the second round of HFPS (labor supply was asked for a 7 day recall). All regressions control for strata, a measure of the dependent variable during the intake survey (where applicable), date fixed effects, assignment to high frequency group and are probability weighted (see in the text for details). All monetary variables are expressed in USD and are winsorized at $5 \%$.
Standard errors clustered at individual level in parentheses. ${ }^{*}, * *$, and $* * *$ indicate significance at $10 \%, 5 \%$, and $1 \%$ respectively.
${ }^{1}$ Credit include digital loans and loans from VSLAs, ROSCAs, banks, microfinance institutions, and moneylenders.

Notes: Transfers include gifts and loans, and both cash and in-kind payments and do not include survey compensation. Variables are measured over the 7 days prior to the survey and converted to daily averages. All regressions control for strata, a measure of the dependent variable during the intake survey (where applicable), assignement to high frequency group and are probability weighted (see in the text for details). Survey date fixed effects are included. All monetary variables are expressed in USD and are winsorized at 5\%.
Standard errors clustered at individual level in parentheses. ${ }^{*}$, ${ }^{* *}$, and ${ }^{* * *}$ indicate significance at $10 \%, 5 \%$, and $1 \%$ respectively.

[^0]:    Notes: See text for discussion of data sources. Means are presented, with standard deviations in parentheses.

[^1]:    Notes: The $y$-axis is the amount actually found in the lockbox during the check in December 2018 and the x -axis is the amount reported as the balance (prior to opening the box). 260 Respondents were assigned to the lockbox check group, and 241 completed pre-lockbox check survey, 215 consented to show us the lockbox, 190 consented to open the lockbox. Panel A shows all boxes, Panel B shows only those below the 75th percentile for both measures. About $50 \%$ of users reported the exact balance in the boxes, $14 \%$ under-reported, and $37 \%$ over-reported.
